

CHAPTER III

SOCIO-ECONOMIC CHARACTERISTICS OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS

1 INTRODUCTION

Population as a producer and consumer is closely related with agriculture. On the one hand, population affects production in general and agricultural outputs in particular by furnishing the required labour. On the other hand, the size of a population and its anticipated growth is the main factor determining food consumption requirements. Regarding the balance between population and consumption, if more people are to be fed than the food or services produced, saving and capital investments will be negatively affected. Moreover, population growth also negatively influences agriculture by putting pressure on the environment, such as water, fertility of land, . . . etc. Population size further influence productivity mainly through the diversification and specialization of the economy, the size of the market, and the importance of foreign trade.

Not only the size, but also the socio-economic characteristics of the population of the agricultural households is important to the agricultural production. Study of the nature of the agricultural sector of a country will not be complete without proper understanding of the socio-economic characteristics of the population engaged in it. The population statistics of the agricultural households can be used to describe the characteristics and distribution of the population in space, its density and degree of concentration, the fluctuation in its rate of growth and the movement from one area to another. Data on population and agriculture will also help in finding out what percentage of resources will be needed at a particular time for the meeting of basic needs of the people and what amount of socially useful and productive labour is available in the country, regardless of whether labour or capital intensive techniques will suit the nation's economy.

Generally, an analysis of statistical data on population residing in agricultural households is important to assess the size, structure and characteristics of the human resources involved in and supported by the sector. Such kind of information will provide the human background for planners and policy makers in their attempt to formulate policies that helps improve the sector's output as well as the living conditions of the rural population.

Cognizant of this fact, the 2001/2002 Ethiopian Agricultural Sample Enumeration has collected basic social and economic characteristics of the population in agricultural households in October 2001. This chapter assesses the resulting data related to the size, the structure and distribution of the population in agricultural households with some selected variables. These variables include size and age-sex structure, household size, relationship to the head of the household, marital status, literacy, educational level, working status, reason for not working, type of occupation, and employment status. Moreover, this chapter presents statistical tables that show the results at zonal and wereda levels. In the Annex to this chapter are also given tables showing Estimates, Standard Errors (S.E.) and Coefficient of Variation (C.V.) for some relevant variables.

2 SIZE AND AGE-SEX STRUCTURE OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS

In this section, the size and age-sex composition of the population in agricultural households of Tigray Region will be assessed. The population in agricultural households comprises all the persons residing in households with at least one agricultural holder, where a holder is defined as a person who exercises management and control over the operation of the agricultural holding such as land and livestock and makes the major decision regarding the utilization of the available resources (detailed explanation of holder and holdings are provided in Chapter II of this report in the section that deals with concepts and definitions). Whenever is appropriate the assessment will be done separately for non-holders, holders and type of holding.

2.1 Size of the Population in Agricultural Households

Summary Table III.1 presents the estimated population size of the agricultural households in Tigray Region classified by sex, place of residence and holding status. According to the result of this sample enumeration, the population in agricultural households of the region is estimated to be 3,488,777. Of the total population in agricultural households, 3,374,403 are residing in rural areas and the remaining 114,374, that is, only 3.3 percent of the population in agricultural households is residing in urban areas.

The enumeration results show that there were 739,917 agricultural holders in the region, making up 21.2 percent of the total population residing in agricultural households. Further breakdown of the agricultural holders by type of holding is presented in Summary Table III.2. Accordingly, holders practicing crop and livestock farms constitute the largest proportion (73 percent) of total holders. Holders practicing crop only farms make up about 20% while those practicing livestock only are 7 percent of total holders.

The enumeration result further shows that the proportion of holders among the males to be significantly higher than their female counterparts. In the rural and the urban areas, the proportion of the holders among the males is about three times and two times higher than that of the females, respectively.

Summary Table III.1 Size of the Population in Agricultural Households by Sex and Place of Residence

Place of Residence/ Sex	Total Population in Agricultural Households		Holders		Members Other Than Holders	
	No.	%	No.	%	No.	%
Rural + Urban						
Both Sexes	3,488,777	100	739,917	21.2	2,748,861	78.8
Male	1,759,360	100	552,808	31.4	1,206,552	68.6
Female	1,729,417	100	187,108	10.8	1,542,309	89.2
Rural						
Both Sexes	3,374,403	100	715,620	21.2	2,658,783	78.8
Male	1,704,278	100	537,060	31.5	1,167,218	68.5
Female	1,670,125	100	178,560	10.7	1,491,565	89.3
Urban						
Both Sexes	114,374	100	24,297	21.2	90,077	78.8
Male	55,082	100	15,749	28.6	39,333	71.4
Female	59,292	100	8,548	14.4	50,744	85.6

Regarding distribution of the population in agricultural households of zones by type of holding the enumeration result presented in Summary Table III.3 shows that in all zone, except Mekele, combination of crop and livestock is the dominant type of holdings where the proportion who combine crop and livestock is highest (78.6 percent) for West Tigray Zone and least (12.2 percent) for Mekele Zone. The majority of the population in agricultural households of Mekele Zone hold livestock only. On the other hand, exclusive crop farming is more common (24.8 percent) in south Tigray Zone and least common (13.4 percent) in West Tigray Zone.

Summary Table III.2 Size of Agricultural Holders by Sex, Type of Holding and Place of Residence

Place of Residence/ Sex	Total Holders		Crop Only		Livestock Only		Crop and Livestock	
	No.	%	No.	%	No.	%	No.	%
Rural + Urban								
Both Sexes	739,917	100	145,477	19.7	54,877	7.4	539,563	72.9
Male	552,808	100	76,750	13.9	29,035	5.3	447,023	80.9
Female	187,108	100	68,727	36.7	25,841	13.8	92,540	49.5
Rural								
Both Sexes	715,620	100	141,301	19.7	44,035	6.2	530,284	74.1
Male	537,060	100	74,551	13.9	22,680	4.2	439,828	81.9
Female	178,560	100	66,750	37.4	21,355	12.0	90,455	50.7
Urban								
Both Sexes	24,297	100	4,176	17.2	10,841	44.6	9,279	38.2
Male	15,749	100	2,199	14.0	6,355	40.4	7,195	45.7
Female	8,548	100	1,977	23.1	4,487	52.5	2,085	24.4

Summary Table III.3 Distribution of Population in Agricultural Households by Holding Status, Type of Holding, Zone and Place of Residence

Zones	Place of Residence	Total Population in Agricultural HHs	Total Holders		Type Holding		
			No.	%	Crop Only	Livestock Only	Crop and Livestock
All Zones	Rural + Urban	3,488,777	739,917	100.0	19.7	7.4	72.9
	Rural	3,374,403	715,620	100.0	19.7	6.2	74.1
	Urban	114,374	24,297	100.0	17.2	44.6	38.2

	Rural	-	-	-	-	-	-
	Urban	8,396	1,423	100.0*	-	83.7	12.2

2.2 Age-Sex Structure of the Population in Agricultural Households

Age and sex are among the important factors that determine the status of individuals in their community in general and their involvement in production process in particular. The age-sex composition of a population of an area is the product of past fertility, mortality and migration trends. Age and sex structure are important for the functioning of the economy including the agricultural economy, since these two attributes constitute the main criteria for determining entrance into the work force and the division of labour. It is also important for several purposes. Among others, age-sex data is useful for in-depth analysis of socio-economic characteristics of a given population. Also, age-sex data is vital for making component and sectorial projections.

The percentage distribution of the population in agricultural households by sex, age group, place of residence, and holding status and type is presented in Summary Table III.4. Also,

the single year age and five years age distribution of the population in agricultural households are presented in Figure III.1 and Figure III.2, respectively. The population in agricultural households in both rural and urban areas is characterized by young age. As the data in the table shows, 53.3 percent and 53 percent of rural and urban agricultural household population are under 18 years of age. Those persons aged 60 years and above constitute nearly equal proportion, that is, 6.5 percent in rural and 6.3 percent in urban areas. According to the age pyramid, the age pattern of the region's agricultural household population appears to be fluctuating (see Figures III.1 to III.3). As can be observed from Figure III.2 the age pyramid began to narrow at the base (0-4 years) and this is possibly due to decline of fertility. The chance of being holder becomes significant after age 30 (see Figure III.3)

The age pattern observed at regional level among total holders also holds true for both crop only holders and crop and livestock holders, with less than 3 percent of the young under age 25 years practicing in crop and livestock agriculture. In the case of persons who are engaged in livestock only, however, the involvement of the young population who are under age 25 years is about one-fifth (20.7 percent). This phenomenon of a significant proportion of the young being livestock only holders is particularly true in rural areas.

The sex distribution of a population can be studied using indices called "sex ratios" that are calculated as a ratio of males per 100 females. When the ratio is over 100, the males are in excess and when less than 100 the females predominate. The sex ratio of the population in agricultural households by holding status and type of holding are calculated and presented at the bottom of Summary Table III.4. In a population where there is no sex selective migration, the overall sex ratio is expected to be around 100. In addition, sex ratio for the population in agricultural households will be affected by movements of people between agricultural and non-agricultural households within the region itself. For the population in agricultural households of Tigray Region, the overall sex ratio is found to be 101.7, showing slight excess of males over females. The situation in urban areas where the result shows a sex ratio of 92.9 is, however, different from that of the rural areas indicating that there are more females than males in urban areas.

The table further shows a sex ratio of 295.4 for agricultural holders. That is, for every 100 female holders there are 295 male holders. The excess of male holders over females is extremely large among those practicing both crop and livestock holding. The pattern observed at regional level also holds true in both urban and rural areas with urban holders showing relatively lower sex ratios for crop and livestock holders and higher sex ratio for those practicing livestock only.

2.3 Household Size

Size of household refers to the entire number of persons- related or unrelated who comprise one private household. In this survey a household is defined as either single person who makes provisions for his own or a group of two or more persons who live together and make common provisions for food and other essentials of living.

Summary Table III.5 presents the distribution of the agricultural households by number of persons per household and average household size for male and female-headed

households. According to the sample enumeration, on September 2001 there were 701,975 agricultural households in Tigray Region. These households altogether accommodates 3,488,777 persons, resulting in average household size of 5.0 persons per agricultural household. Regarding the distribution of persons per household, the data in the table shows that, the majority of households have 6-9 persons (37.2 percent) closely followed by those with 4-5 persons (32.4 percent) and 2-3 persons (23.2 percent). Single person households and households with 10 and more persons each comprise about 5 percent and 2 percent, respectively.

Summary Table III.5 Distribution of Agricultural Households by Household Size, Sex of Head, and Place of Residence

Rural/ Urban and Sex of Head	Total Population in Agricultural HHs	Total Households		Household Sizes					Average Household Size
		N ^e	%	One Member Household	2-3 Members Household	4-5 Members Household	6-9 Members Household	10 & above Members Household	
Rural + Urban									
Total	3,488,777	701,975	100	4.9	23.2	32.4	37.2	2.3	5.0
Male Head	2,920,428	534,214	100	1.7	17.3	33.0	45.0	2.9	5.5
Female Head	568,349	167,760	100	15.2	41.9	30.3	12.3	0.4	3.4
Rural									
Total	3,374,403	677,844	100	4.9	23.1	32.4	37.4	2.3	5.0
Male Head	2,835,040	518,324	100	1.7	17.3	33.0	45.1	2.9	5.5
Female Head	539,363	159,520	100	15.3	41.8	30.2	12.3	0.3	3.4
Urban									
Total	114,374	24,130	100	5.9	26.4	33.0	32.2	2.6	4.7
Male Head	85,388	15,890	100	2.4	18.0	33.7	42.2	3.7	5.4
Female Head	28,986	8,240	100	12.5	42.5	31.6	12.8	0.6	3.5

Average household size for agricultural households in rural areas is slightly higher than that in urban areas. The enumeration results further show that the size of households differs by the sex of head. In both rural and urban areas, male-headed agricultural households appear to have larger household size, with the difference more pronounced in rural areas. As can be observed in Summary Table III.5, on average, male-headed agricultural households in both rural and urban areas of the region have about 2 more

persons. In rural and urban areas, about 15 percent and 13 percent of female-headed agricultural households are occupied by women living alone, respectively.

The data presented in Summary Table III.6 shows that average household size in West, East and Central Tigray are similar. South Tigray Zone has relatively lower household size than the other zones. The same pattern also holds true in rural areas. In urban areas, average household size of Mekele Zone exceeded the other zones by about one person.

Summary Table III.6 Average Household Size by Zone, Place of Residence and Sex of Head of Households

Zones	Rural + Urban			Rural			Urban		
	Total	Male Headed	Female Headed	Total	Male Headed	Female Headed	Total	Male Headed	Female Headed

3 SOCIO-ECONOMIC CHARACTERISTICS OF THE POPULATION IN AGRICULTURAL HOUSEHOLDS

In addition, the 2001/2002 Ethiopian Agricultural Sample Enumeration has collected some basic social and economic characteristics of the population residing in agricultural households. The information collected included relationship to the head of the household, marital status, literacy status and educational level, work status, employment status and type of occupation. In this respect, this section of the chapter presents some of the major findings of the sample census.

3.1 Relationship with The Head of Household

Relationship to the head of the household is an important measure of household formation and hence it is a pivot on which modern method of projecting households and

families turns. Relationship to the head of the household is considered in this report for its influence on agricultural holding status and certain decision to be taken related to agricultural activities. In the sample census the head of a household is any member of the household who is recognized as a head by the other members.

Summary Table III.7 presents the distribution of the population in agricultural households by sex, relationship to the head of the household, holding status and type of holdings for Tigray Region. Among both the males and the females the majority of the population in agricultural households is children of heads (58 percent). Next to children of heads are the heads (20.1 percent) and the spouses (14.5 percent) in the household. The proportion of heads among the males is substantially higher than that of the females, reflecting the fact that males in most societies assume execution of the major roles of the agricultural activities and the head is considered as the main breadwinner in the household as well as the ones who merely bear responsibility.

The overwhelming majority of both male and female holders (96.3 percent, and 88.4 percent, respectively) are heads of households and this dominance of heads of households is highly pronounced in the crop and livestock, and crop only holdings. Children and other relatives have substantial contribution among livestock only holders (28.5 percent, and 3.4 percent, respectively) and this phenomenon is more pronounced in the rural areas than urban areas.

Summary Table III.7 Size of Population in Agricultural Households by Sex, Relationship to the Head of Household, Holding Status and Type of Holding

3.2 Marital Status

This section presents the level and pattern of marital status of the population in the agricultural households in Tigray Region. In addition to being one of the important proximate determinants of fertility, marriage has economic and social implications. Generally, marriage is basic to family formation. In countries like Ethiopia, where the agriculture is subsistence farming, families play central role in the production processes, income maintenance, economic status,...etc.

In the census questionnaire, information was collected on the marital status of the population 10 years of age and older. The marital status was categorized into four main groups, namely never married (single), married, divorced and widowed. A person who had never been married is considered to be single, whereas married persons include, couples who are living together bonded by any kind of marital engagement at the time of the census (traditional, religious or civil marriage). Separated couples are also considered to be married, unless they had dissolved their marriage agreement legally, a person who had been married but whose marriage was dissolved through divorce before the census day is categorized as divorced, and a person whose marriage was dissolved through the death of the spouse is categorized as widowed.

Summary Table III.8 presents the distribution of the population in agricultural households by marital status and broad age group. As the data in the table indicates, little below half of the population in the agricultural households in the region is in marital union at the time of the enumeration. Those who never married constitute about 41 percent while 10.7 percent have dissolved their marriage due to divorce or the death of the spouse. The data further show that a higher proportion of the males to be in single-hood status while the incidence of dissolution of marriage are significantly higher among the females than the males. Regarding the marital status of the agricultural holders in the region, the data in the table shows that, the majority (71.7 percent) were in marital union at the time of the census.

About 92 percent and 74 percent of the young (aged 10-17 years) female population in agricultural households, and the holders, respectively are single, indicating some early start of marriage in the region's female population, particularly among holders. Further, marriage is universal in the region as evidenced by the fact that at age 50 and over the proportion of single is only about one percent for each of the males and the females.

3.3 Level of Education of the Population in Agricultural Households

Education is another important social characteristic that affects the well being of individuals or societies in general. Level of education is associated with the participation as well as the productivity of agriculture. Education improves knowledge and use of agricultural practices and applied technology in agricultural operations. Therefore, compiling and analyzing data on the educational attainment of the population in the agricultural households is essential for development planning.

The 2001/02 Agriculture Sample Enumeration of Ethiopia provides two types of data regarding education, namely, literacy status and educational attainment of persons aged 5 years or more. In the census a person is considered as literate if he/she can read and write simple sentence in any language. Educational attainment was obtained by asking individuals who can read and write concerning the highest grade completed and response were classified as non formal education and grades completed in the formal school system. Formal education /regular school/ is used to describe the educational system that provides a ladder by which individuals may progress from primary school through universities. On the other hand, the non-formal education that are entertained in this census includes those persons that were not in the formal schools such as self directed, or religious/socially directed learning or teachings to read and write, with any of the languages.

The population in the agricultural households aged 10 years and over in Tigray Region classified by sex, literacy status and level of education, holding status and type of holding and place of residence is presented in Summary Table III. 9. The level of education in this table is classified as: primary level education which include grades 1-6, and above primary level education.

The data in the table reveals that 36.2 percent of the population in the agricultural households of Tigray Region to be literate. The literacy level among the urban dwellers (65.5 percent) is more than double compared to that of rural areas (35.1 percent). The census result also shows that, relatively, more males than females are found to be literate in both rural and urban areas. For instance, in rural areas 47.2 percent of males against 23.1 percent of females were literate.

About 9 percent and 7 percent, respectively, of the rural and the urban population aged 10 years and over in agricultural households were able to read and write through non-formal education. Those who attained primary level education make up 26.7 percent and 38.1 percent of the population in agricultural households of the rural and urban areas, respectively. On the other hand, very small proportion (only 3.8 percent) of the population in the rural areas of agricultural households and a relatively higher proportion (20.6 percent) of the population in the urban agricultural households have attained an educational level of above primary school.

The proportion of literates did not show much variation among the agricultural holders and non-holders. On the other hand, those who are only livestock holders are better off in terms of level of education than those engaged in crop only and crop and livestock, probably due to a high proportion of young population among only livestock holders.

With respect to the proportion of literates, population in agricultural households of Mekele Zone has relatively the highest level, probably due to its exclusive urban nature. The advantage of Mekele Zone in this regard is registered for both members other than holders and agricultural holders (see Summary Table III.10). In Central Tigray, East Tigray and South Tigray zones livestock holders are more literate than the other types of holdings, while those engaged in crop and livestock agriculture are more literate in West Tigray Zone.

3.4 Work Status of the Population in Agricultural Households

All persons aged 10 years and over who are members of the agricultural households in both urban and rural areas were asked whether or not they have been engaged in productive activity during most of the 12 months prior to the census date. In the census economic or productive activity was defined in terms of production of goods and services that fall within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990). Hence, in the 2001/2002 Agricultural Sample Enumeration, economic activity or productive activity is defined as a work that involves the production

of goods and/or services for sale or exchange and production of certain products for own consumption. According to the above general definition, economic activity covers production of goods and services intended for sale on the market, production of other goods and services such as government activities; production and processing of primary products (agriculture, hunting, fishing, forestry and logging; and mining and quarrying) for own consumption, processing of primary products by the producers themselves, production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or public organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis.

For a person to be counted as working during most of the last 12 months, he/she has to be engaged in any kind of economic activity at least for half of the reference year. In the case of persons engaged in agriculture, it was decided to consider them as being engaged in economic activity during most of the last 12 months if they have worked during most of the main agricultural season of the reference year. The distribution of the population aged 10 years and over in agricultural households of Tigray Region classified by sex, age group and work status is presented in Summary Table III.11. According to the census result, out of the total 2,346,254 persons aged 10 years and over who are members of the agricultural households in the region, 79.5 percent were reported to have engaged in some kind of productive activity during the 12 months prior to the enumeration date. The proportion of working population among the male is relatively higher than that of females, that is, 86.2 percent of the males against 72.9 percent among the females were engaged in productive activity during the 12 months prior to the survey data.

Consistent with previous surveys, engagement in productive activity is higher in the rural areas than the urban areas of the region. In rural areas more than four-fifths of the agricultural population was working during most of the 12 months prior to the survey date. Where as, the working persons in urban areas constituted about 51 percent of the population in question. In both rural and urban areas, the proportion working among the males is higher than that of the females with almost equal range of gender disparity (See Figure III.4).

As can be seen from Figure III.5 engagement in productive activity is highest for persons of middle age (30 -49 years). As expected, the proportion working is lowest for the children aged 10-17 years. This phenomenon holds true for both the males and the females in rural as well as urban areas. One special feature in urban areas is that the proportion of the working children aged 10-17 years is very low compared to those persons in the upper age groups (see Figure III.5).

Summary Table III.12 presents the proportion of working population in agricultural households by zone, place of residence and sex. The levels of engagement in productive activity show some variation between zones. In rural areas, the proportion engaged in productive activity ranged from 75.8 percent for East Tigray Zone to 85 percent for Central Tigray Zone. On the other hand, in urban areas the proportion ranged from 42.8 percent for Mekele Zone to 56.8 percent for Central Tigray Zone. In all the zones males have higher engagement level than females, the gap being wider for rural and urban South Tigray Zone.

Summary Table III.12 Proportion of Population in Agricultural Households Aged 10 Years and Over Who Were Engaged in Productive Activities by Sex, Place of Residence and Zone

Zones	Rural + Urban			Rural			Urban		
	Both Sexes	Male	Female	Both Sexes	Male	Female	Both Sexes	Male	Female
Tigray Region	79.5	86.3	72.9	80.7	87.3	74.0	51.0	57.5	45.1

Mekele	42.6	48.2	37.3	-	-	-	42.8	48.2	37.3

3.5 Reason for Not Working

The distribution of non-working population in agricultural households by main reason for not working and selected background variables is presented in Summary Table III.13. In both the rural and the urban areas of the region, the two most important reasons for not working are attending school or being a student and home making, together constituting 78.8 percent (46.3% + 32.5%). Disability or illness, and old age have very little contribution. The patterns, in the urban and the rural areas are similar, with higher proportion of students in urban areas.

The distribution of reasons for not working among the male population is different from that of the females. Students make up the overwhelming majority (72.8 percent) among non-working males while homemaking is the major (46.1 percent) reason for not working among the females.

The pattern of reason for not working varies as age increases. As expected students make up the majority (72.9 percent) of non working population aged 10-17 years, while students and homemakers are important reasons among those aged 18-29 years, contributing 46 percent and 44 percent, respectively. On the other hand, homemakers constitute the majority (73.8 percent) of non-working population aged 30-49 years, while old age/pension is the major reason for not working among those aged 50 years and above.

3.6 Type of Occupation for Working population

Data on type of occupation was collected for all persons who have reported to have been engaged in productive activity during most of the last 12 months. The response to the question is classified as fully agricultural, partially agricultural and non-agricultural. This information provides the extent to which the agricultural population is engaged in other activities.

Summary Table III.13 Non Working Population in Agricultural Households by Reason for Not Working and Some Background Variables

Back ground Variables	Reason for not Working					
	Total not Working	Student	Home Maker	Disabled /ill	Old Age/ Pension	Others
All Persons	477,343	46.3	32.5	4.6	9.0	7.5
Place of Residence						
Rural	437,479	44.5	33.4	4.9	9.5	7.7
Urban	39,863	66.9	23.2	1.7	3.8	4.4
Sex						
Male	159,878	72.8	5.6	5.6	6.8	9.2

Age						
10 - 17	237,813	72.9	19.5	1.7	0.1	5.8
18 - 29	101,900	46.0	44.1	4.6	0.3	5.0
30 - 49	61,863	1.1	73.8	9.6	1.2	14.2
50+	75,767	0.3	24.3	10.0	55.0	10.4
Zones						
West Tigray	129,813	35.5	42.9	4.5	8.7	8.5
Central Tigray	119,338	59.5	15.5	6.4	11.9	6.7
East Tigray	101,042	50.3	27.4	4.4	10.4	7.5
South Tigray	123,347	40.8	42.9	3.4	5.6	7.3
Mekele	3,802	78.5	15.0	-	1.7	4.0

Summary Table III.14 presents the distribution of the population in the agricultural households aged 10 years and over who are engaged in productive activity by type of occupation and background variables. The census result shows that about 93 percent of the population in agricultural households aged 10 years and over was engaged in fully agricultural activities, while only about 5.4 percent of the population was engaged in partially agricultural activities. The proportion of population engaged in non-agricultural activities only was negligible, amounting to 1.2 percent. Contrary to the expectations, in urban areas the proportion engaged in fully agricultural activities is larger than those who engaged in partial or non-agricultural activities.

Similar pattern of type of occupation was observed among the males and the females. Also there is little variation by age in the type of occupation. All the zones, except Mekele Zone have similar distribution of type of occupation for the population in agricultural households. Mekele Zone depicted substantially higher proportion of non-agricultural population.

Summary Table III.14 Percentage Distribution of Population in Agricultural Households Engaged in Productive Activity by Type of Occupation and Some Background Variables

Back ground Variables	Total Working		Fully Agricultural	Partially Agricultural	Non Agricultural
	No.	%			
All Persons	1,866,123	100	93.4	5.4	1.2
Place of Residence

Mekele	2,848	100	37.5	29.2	33.3

3.7 Employment Status of Population Engaged in Agricultural Activities

Employment status of working population indicates the level of involvement and degree of decision-making in the respective activities. In this sample enumeration persons engaged in fully or partially agricultural activities were asked to report the employment status in that activity.

According to the data presented in Summary Table III.15, unpaid family workers constituted the highest proportion (61.3 percent) of the population in agricultural households who are engaged in agricultural activities. About 34.4 percent of the working population were own account workers working in their farms alone or with the help of family members but with out hiring labor. The proportion who hires others in their farm is only 3.2 percent, showing the low capacity of the region's agricultural industry to create employment opportunity for non holders. On the other hand, only one percent of

the population in agricultural households engaged in agricultural activities were employees.

Summary Table III.15 Percentage Distribution of Population in Agricultural Households Engaged in Agricultural Activities by Employment Status and Some Background Variables

Place of Residence Age/Sex	Total Engaged in Agricultural Activity		Employer	Own Account Worker	Employee	Unpaid Family Worker
	No	%				
All Persons	1,844,118	100	3.2	34.4	1.0	61.3
Place of Residence						
Rural	1,808,672	100	3.1	34.0	1.0	61.9

10 - 17	471,603	100	0.2	0.5	1.6	97.7
18 - 29	482,430	100	1.2	16.0	1.8	81.0
30 - 49	529,082	100	5.0	53.1	0.4	41.5
50+	361,003	100	7.4	75.7	0.2	16.6
Zones						
West Tigray	472,090	100	4.4	31.8	1.5	62.3
Central Tigray	624,155	100	1.9	33.5	0.5	64.1
East Tigray	303,295	100	2.2	36.7	0.5	60.6
South Tigray	442,679	100	4.6	36.7	1.7	57.0
Mekele	1899	100	6.0	48.1	9.0	36.9

The situations in urban and rural areas are different, where the tendency to work for the family without payment is less common in urban areas. Also, being employer is relatively more pronounced in the urban areas than the rural areas. The overwhelming majority (80 percent) of female respondents in agricultural households who are engaged in agricultural activities are unpaid family workers while self-employment (own account) is relatively the common type of employment status (48.4) among males, showing the dominance of males over females in the tradition/culture of the society. As in the case of other variables, the distribution by employment status of the working population in agricultural households did not show noticeable variation among the zones, with exception of Mekele Zone.
