No cut-off ☒

14. What were the different stages in your sampling procedure?

PLEASE WRITE IN:

- 1- The sampling frame is the extended roster of households for the post enumeration survey of the 2006 Census.
- 2- This frame covered all governorates (except the five frontiers' Governorates hosting about 1.8% of the total population), within about 480 segments (average 100 HH).
- 3- To reduce sampling error, it was only to select 25 HH from each segment to increase the number of segments selected from each Governorate and that Number of segments was proportional to its size according to the 2006 population census.
4. Within Governorates, rural/urban parts were represented by selecting separately the number of segments proportional to its population share according to the 2006 census. Overall, a total of 122 segments were selected (out of which 56 from Urban areas and the balance from Rural areas of each Governorate), thus drawing a self-weighted sample for each Governorate based on its share of the 2006 population census.
5. Both segments were selected separately from the frame of Urban/Rural area for each Governorate using systematic random sampling.
- 5 - Households were also selected within segments (25 households from each segment) using systematic random sampling.

15. What was the final number of clusters or sampling points?

No clusters ☒

18. Were there any quota-controls on the type of individual selected to take part in the survey (for example, age or sex controls)?

IF 'YES'

21. In what way was substitution permitted?

In every segment there was an alternative sample, that was also randomly selected, if an appropriate person within the household, was not available to answer the questionnaire, an alternative sampling unit would be selected. The alternative sample represented only 3.3% of the total sample.

EVERYONE PLEASE ANSWER
